## Summary

*Lancet Infect Dis* 2019;  
19: 56–66

Published Online  
November 5, 2018

<http://dx.doi.org/10.1016/>

**Background** Infections due to antibiotic-resistant bacteria are threatening modern health care. However, estimating their incidence, complications, and attributable mortality is challenging. We aimed to estimate the burden of infections caused by antibiotic-resistant bacteria of public health concern in countries of the EU and European Economic Area (EEA) in 2015, measured in number of cases, attributable deaths, and disability-adjusted life-years (DALYs).

Bakteriye, antibiyotik direncinin tipine, enfeksiyon tipine ve insidansına spesifik DA-Ylleri tahmin etmeyi amaçlayan bir çalışmadır. Global Hastalık Yükleme Yüklü

16 farklı bakteri suşu için  
5 farklı tip enfeksiyonun  
30 ülkede insidansı

Global Hastalık Yükleme Yüklü, standart yaşam beklentisi tablosu kullanılmış.

- 100.000 popülasyon başına görülen engelli yaşam süresinin %67.9'si

1. 3.KS dirençli *E. coli*
2. MRSA
3. CR *P. aeruginosa*
4. 3.KS dirençli *K. pneumonia*

## Decolonization to Reduce Postdischarge Infection Risk among MRSA Carriers

S.S. Huang, R. Singh, J.A. McKinnell, S. Park, A. Gombosev, S.J. Eells, D.L. Gillen, D. Kim, S. Rashid, R. Macias-Gil, M.A. Bolaris, T. Tjoa, C. Cao, S.S. Hong, J. Lequieu, E. Cui, J. Chang, J. He, K. Evans, E. Peterson, G. Simpson, P. Robinson, C. Choi, C.C. Bailey, Jr., J.D. Leo, A. Amin, D. Goldmann, J.A. Jernigan, R. Platt, E. Septimus, R.A. Weinstein, M.K. Hayden, and L.G. Miller, for the Project CLEAR Trial

- CLEAR (Changing Lives by Eradicating Antibiotic Resistance) çalışması
- Çok merkezli randomize kontrollü
- MRSA taşıyıcılarında taburculuk sonrası hijyen eğitimi vs eğitim + dekolonizasyonun enfeksiyon gelişimi riskine etkisi

# DEKOLONİZASYON GRUBU

## Day of Enrollment/Prior to Discharge

- Receive a copy of the signed consent form
- Complete a contact information sheet
- Complete a survey with Project CLEAR study staff
- Have swabs of the nose, throat, armpit/groin, and any wounds taken by Project CLEAR study staff
- Receive a binder containing MRSA educational materials and instructions for soap and medicine to remove MRSA
- Select a follow up clinic location
- Schedule a one month follow up visit at that study clinic
- Prior to discharge, receive decolonization products to remove MRSA
  - Special soap: Hibiclens® (chlorhexidine)
  - Special mouthwash: PerioGard® (chlorhexidine)
  - Special nose medicine: Bactroban Nasal® (mupirocin)

## After You Leave the Hospital

- You will be followed in the trial for one year after discharge
- Perform the “Decolonization Protocol” (treatment) which will be done:
  - Twice a month for 6 months
  - Each decolonization treatment lasts for 5 days at a time and includes:
    - Hibiclens® bathing/showering once daily, for 5 days
    - PerioGard® mouthwash twice daily, for 5 days
    - Bactroban Nasal® ointment in both nostrils twice daily for 5 days

6 ay süre ile

- Günlük %4'lük klorheksidin ile banyo/duş
- %0.12'lik klorheksidin ile ağız gargara
- Ayda 1 kez 5 gün süre ile nazal mupirosin

1 yıl izlem

---

## What I Need for Showering with Hibiclens®

1. Hibiclens® bottle and pump
2. Large mesh sponge
3. Two minute timer
4. Clean towel

## How To Use Hibiclens®

Use Hibiclens® soap INSTEAD of your regular soap and shampoo. Please **DO NOT USE** other soaps, shampoos, or lotions since many of these products will inactivate Hibiclens® and prevent it from removing MRSA. Only hair conditioner may be used with Hibiclens®. **Lotions compatible with Hibiclens® will be provided upon request.**

- Wet face and hair with water
- With head and hair out of water stream, wash face and hair by pumping Hibiclens® onto hands and firmly massaging onto face and into hair and scalp
  - Ensure Hibiclens® reaches skin around nose. Avoid eyes and ear canal.
- Rinse face and hair with water
- If you use hair conditioner, apply it next, rinse
- Wet the mesh sponge
- Dispense 3 pumps of Hibiclens® onto the wet sponge and rub vigorously into lather
  - Hibiclens® will not lather until you massage Hibiclens® thoroughly into sponge
- Wash body by turning off shower water and **FIRMLY MASSAGING** the soapy Hibiclens® sponge onto your skin.
- **\*\*IMPORTANT\*\* for Hibiclens® to work, you should turn the WATER OFF**

- Soap all areas of neck with special attention to getting soap between all skin folds
  - Wash arms and legs one at a time by massaging skin **THOROUGHLY** with the soapy Hibiclens® sponge
  - Then apply soap to chest and back using firm massage
  - Then apply soap to abdomen using firm massage
  - Then apply soap to hip and groin, followed by genitals and buttocks using firm massage
  - Turn on the **2 minute shower timer. For the best effect, Hibiclens® needs to remain on all areas of your skin for at least 2 minutes.**
  - Reapply soap a **SECOND TIME** to all skin areas from the neck down with firm massage exactly as above.
  - Please place special attention to the neck, armpit, groin, areas between the fingers and toes, and all skin folds, including under the breasts for women. Firmly massage Hibiclens® into all skin areas.
  - Turn on water after 2 minute timer goes off
  - Rinse and pat dry with clean towel
-

## Bactroban Nasal<sup>®</sup> (Mupirocin) Ointment

### Instructions for Use

Bactroban Nasal<sup>®</sup> (mupirocin) is an antibiotic ointment that is FDA approved for use in your nose to get rid of MRSA. Before applying, please review all instructions below and contact Project CLEAR study staff with any questions at [REDACTED]

- Use Bactroban Nasal<sup>®</sup> during your assigned weeks of every month (either **1<sup>st</sup> and 3<sup>rd</sup> weeks** OR **2<sup>nd</sup> and 4<sup>th</sup> weeks**)
- During these weeks, use **twice per day for 5 days (Monday through Friday)**

### Special Considerations

- Do not use Bactroban Nasal<sup>®</sup> if you have an allergy to the product
- Avoid contact with eyes

- 1) Tilt your head back
- 2) Turn cap counter-clockwise to puncture the seal
- 3) Apply half the tube content directly into each nostril
- 4) You may use a q-tip to help distribute the ointment
- 5) Press nostrils together and massage for 1 minute
- 6) Place used tube into disposal box and bring with you to your next clinic visit
- 7) Wash your hands with soap and water as soon as you are finished

## PerioGard<sup>®</sup> (Chlorhexidine) Mouthwash

### Instructions for Use

PerioGard<sup>®</sup> is a mouthwash containing chlorhexidine that will reduce the amount of MRSA that lives in the throat and may lower your risk for MRSA infection. It also kills the germs on your gums and teeth. Before using, please review all instructions below and contact Project CLEAR study staff with any questions at [REDACTED] or EndMRSA@uci.edu.

- Use PerioGard<sup>®</sup> during your assigned weeks of every month (either **1<sup>st</sup> and 3<sup>rd</sup> weeks** OR **2<sup>nd</sup> and 4<sup>th</sup> weeks**)
- During these weeks, use **twice per day for 5 days (Monday through Friday)**

# KONTROL GRUBU

## Calls and Follow Up

### Day of Enrollment/Prior to Discharge

- Receive a copy of the signed consent form
- Complete a contact information sheet
- Complete a survey with Project CLEAR study staff
- Have swabs of the nose, throat, armpit/groin, and any wounds taken by Project CLEAR study staff
- Receive a binder containing MRSA educational materials
- Select a follow up clinic location
- Schedule a one month follow up visit at that study clinic

### After You Leave the Hospital

- You will be followed in the study for one year after discharge
- Attend follow up study clinic visits 1, 3, 6, & 9 months after enrollment
  - You will be compensated for each visit
  - During each visit:
    - A survey will be completed with clinic study staff
    - Repeat swabs of nose, throat, armpit/groin, and any wounds will be taken by study staff
    - Additional educational material will be given to you
- Receive phone calls twice a month for one year following discharge
  - Two follow up calls a month for an update on outcomes

## Postdischarge Infection Risk among MRSA Carriers

**TO THE EDITOR:** The article by Huang et al. (Feb. 14 issue)<sup>1</sup> reports a lower incidence of *Staphylococcus aureus* infections among trial participants who were colonized with MRSA if, instead of standard hygiene education, they received a decolonization regimen that included bathing with chlorhexidine once daily for 5 days, and the use of chlorhexidine mouthwash twice daily for 5 d

forward swap for bathing soap, and the use of mupirocin and chlorhexidine mouthwash took only a few minutes. Most participants had no

decolonization group. Further review of the tables in the Supplementary Appendix (available with the full text of their article at NEJM.org) indicates that the absolute difference in the risk of gram-positive infection was lower by approximately 1.5 infections per 10,000 participant-days or approximately 1 less gram-positive infection every 7.7 years among participants who totally adhered to the decolonization regimen. The effort and cost required for this limited response appear to be disproportionate to the benefit.

any would not be because they had any incon-

common and seen from the Centention reminds team infections in the United

**THE AUTHORS REPLY:** colonization depends on patient preference in the selection of the patients who enroll. This level of adherence in a randomized 1-year trial indicates that the intervention is effective. It suggests that the prevention is meaningful to persons with MRSA. Second,

Third, MRSA infections are common and serious. A recent report on *S. aureus* from the Centers for Disease Control and Prevention reminds us that there are 119,000 bloodstream infections and 20,000 related deaths annually in the United States.<sup>1</sup> In our trial, serious MRSA infection developed in 1 in 10 participants in the control (education) group in the year after discharge; 29% of the cases involved bacteremia, and 85% led to hospitalization. Overall, the number needed to treat is approximately 30 patients to prevent an infection or hospitalization. If physicians can identify patients who will adhere to the regimen, then the number needed to treat is 12. The relatively low cost of the intervention products, which are generic and widely available, the relative simplicity and acceptability of the regimen, and the personal and health care costs of MRSA disease and associated hospitalization suggest that treatment is worth considering.

and the use of mouthwash took participants had no many would not it because they ned any incon-

## **AUTHORS' CONCLUSIONS**

### **Implications for practice**

It is not clear whether bathing with chlorhexidine reduces hospital-acquired infections, mortality or length of stay in the intensive care unit, or whether chlorhexidine use results in more skin reactions, because the certainty of the evidence is very low. One study is awaiting classification and two studies are ongoing; we do not know if inclusion of these studies in future updates of this Cochrane Review will increase our certainty in the results of the review.

# Time-Series Analysis of Health Care–Associated Infections in a New Hospital With All Private Rooms

Emily G. McDonald, MD, MSc; Nandini Dendukuri, PhD; Charles Frenette, MD; Todd C. Lee, MD, MPH

- 1 Ocak 2013- 31 Mart 2015 vs 1 Nisan 2015 – 31 Mart 2018
- Tüm dahili, cerrahi servisler ve YBÜ’lerdeki hastalar yatışta ve sonrasında haftalık olarak MRSA ve VRE açısından taranmış.
- Hastaneye yatıştan 72 saat sonra veya taburculuktan 4 hafta sonrasına kadar olan C. difficile enfeksiyonları ve MRSA ve VRE’ye bağlı enfeksiyonlar değerlendirilmiş.

Figure 1. Nosocomial Vancomycin-Resistant *Enterococcus* (VRE) Colonization Rate Before and After Move to a New Hospital With All Private Rooms

Figure 2. Nosocomial Methicillin-Resistant *Staphylococcus aureus* (MRSA) Colonization Rate After Move to a New Hospital With All Private Rooms

Table. Number of Colonizations, Infections, Patient Days, and Mean Unadjusted Rates Before and After the Move

| Variable       | Before the Move <sup>a</sup> |                                                        | After the Move <sup>b</sup> |                                                        |
|----------------|------------------------------|--------------------------------------------------------|-----------------------------|--------------------------------------------------------|
|                | No.                          | Unadjusted Rate per 10 000 Patient-Days, Mean (95% CI) | No.                         | Unadjusted Rate per 10 000 Patient-Days, Mean (95% CI) |
| VRE            |                              |                                                        |                             |                                                        |
| Colonizations  | 766                          | 35.0 (32.6-37.6)                                       | 209                         | 6.6 (5.7-7.5)                                          |
| Infections     | 55                           | 2.5 (1.9-3.3)                                          | 14                          | 0.4 (0.2-0.7)                                          |
| MRSA           |                              |                                                        |                             |                                                        |
| Colonizations  | 129                          | 5.9 (4.9-7.0)                                          | 112                         | 3.5 (2.9-4.2)                                          |
| Infections     | 27                           | 1.2 (0.8-1.8)                                          | 37                          | 1.2 (0.8-1.6)                                          |

# The Evidence-Based Hospital— A Case for Single-Patient Rooms

D. Kirk Hamilton, PhD, FAIA, FCCM

Since the 1980s there has been growing recognition that the design of the physical environment has a significant impact on clinical outcomes.<sup>1</sup> Consistent with the principles of evidence-based medicine, health care organizations are beginning to develop an evidence-based approach to design. In the past, ventilation methods occurred in blocks of diagnostic and procedure rooms, and the footprint of a ward was large. About these new evidence-based designs, fewer beds, as in the past, were set aside for

A growing body of research on individual patient rooms and private rooms, however, as shown in the study by McDonald and colleagues,<sup>3</sup> will not be sufficient to combat the growing risk of MRSA and *C difficile*.

# Contact precautions in single-bed or multiple-bed rooms for patients with extended-spectrum $\beta$ -lactamase-producing *Enterobacteriaceae* in Dutch hospitals: a cluster-randomised, crossover, non-inferiority study

Marjolein F Q Kluytmans-van den Bergh, Patricia C J Bruijning-Verhagen, Christina M J E Vandenbroucke-Grauls, Els I G B de Brauw, Anton G M Buiting, Bram M Dieder, Erika P M van Elzakker, Alex W Friedrich, Joost Hopman, Nashwan al Naiemi, John W A Rossen, Gijs J H M Ruijs, Paul H M Savelkoul, Carlo Verhulst, Margreet C Vos, Andreas Voss, Marc J M Bonten, Jan A J W Kluytmans, on behalf of the SoM Study Group\*

- ESBL + *Enterobacteriaceae* yayılmasını önlemede çok kişilik odalarda temas izolasyonu uygulama vs tek kişilik odalarda temas izolasyonu uygulaması
- Hollanda'da yapılmış cluster randomised non inferiority çalışması
- İlk!

# Contact precautions in single-bed or multiple-bed rooms for patients with extended-spectrum $\beta$ -lactamase-producing *Enterobacteriaceae* in Dutch hospitals: a cluster-randomised, crossover, non-inferiority study

- 2012 yılında Hollanda'da 6 üniversite hastanesi, 9 eğitim araştırma hastanesi ve 1 genel hastanesinin dahili ve cerrahi kliniklerinde
- 18 ay süre
- ESBL + *Enterobacteriaceae* nedeniyle temas izolasyonu uygulanmaya başladıktan 5-9 gün sonra klinikte yatan diğer hastalar taranmış.
- Klonal ilişki değerlendirilmiş.

# Contact precautions in single-bed or multiple-bed rooms for patients with extended-spectrum $\beta$ -lactamase-producing Enterobacteriaceae in Dutch hospitals: a cluster-randomised, crossover, non-inferiority study

616 index hasta, 9527 aynı klinikte yatan hasta verisi incelenmiş.

|                                         | Tek kişilik oda | Çok kişilik oda |
|-----------------------------------------|-----------------|-----------------|
| ESBL + <i>Enterobacteriaceae</i> bulaşı | %5              | %6              |
| Median hastanede kalış süresi           | 11              | 11              |
| 30 günlük mortalite                     | %4              | %4              |

Contact precautions in single-bed or multiple-bed rooms for patients with extended-spectrum  $\beta$ -lactamase-producing Enterobacteriaceae in Dutch hospitals: a cluster-randomised, crossover, non-inferiority study

Contact precautions in single-bed or multiple-bed rooms for patients with extended-spectrum  $\beta$ -lactamase-producing Enterobacteriaceae in Dutch hospitals: a cluster-randomised, crossover, non-inferiority study

**ESBL + *Enterobacteriaceae*'da temas izolasyonu stratejisini değerlendiren ilk randomize çalışma**

YBÜ ve hematoloji klinikleri dışında ESBL + *Enterobacteriaceae*'da temas izolasyonu stratejisinin çok kişilik odada uygulanması, tek kişilik odada uygulanması kadar etkindir.

# Changes in hospital safety following penalties in the US Hospital Acquired Condition Reduction Program: retrospective cohort study

Roshun Sankaran,<sup>1,2</sup> Devraj Sukul,<sup>2</sup> Ushapoorna Nuliyalu,<sup>3,4</sup> Baris Gulseren,<sup>1</sup> Tedi A Engler,<sup>1,3</sup> Emily Arntson,<sup>1,2</sup> Hanna Zlotnick,<sup>5</sup> Justin B Dimick,<sup>2,3,4</sup> Andrew M Ryan<sup>1,3,4</sup>

- Hastaneden edinilmiş durum azaltma programı (HACRP)
- Medicare and Medicaid kayıtlı tüm hastaneleri HAC'ye göre sıralayıp en kötü %25'lik dilimdeki hastanelere ödeme yaparken %1 ceza kesmekte.

## Changes in hospital safety following penalties in the US Hospital Acquired Condition Reduction Program: retrospective cohort study

Roshun Sankaran,<sup>1,2</sup> Devraj Sukul,<sup>2</sup> Ushapoorna Nuliyalu,<sup>3,4</sup> Baris Gulseren,<sup>1</sup>  
Tedi A Engler,<sup>1,3</sup> Emily Arntson,<sup>1,2</sup> Hanna Zlotnick,<sup>5</sup> Justin B Dimick,<sup>2,3,4</sup> Andrew M Ryan<sup>1,3,4</sup>

- 2015 yılında 724 hastaneye toplam 373 milyon dolar para cezası kesilmiş. Bunlar arasından 708 hastaneyi dahil etmişler.

Pulmoner emboli  
DVT  
İatrojenik pnömotorax  
Postop sepsis  
Bası yarası

Ceza almak hastaneden edinilen  
durumlarda azalmaya sebep oluyor mu?

## Changes in hospital safety following penalties in the US Hospital Acquired Condition Reduction Program: retrospective cohort study

Roshun Sankaran,<sup>1,2</sup> Devraj Sukul,<sup>2</sup> Ushapoorna Nuliyalu,<sup>3,4</sup> Baris Gulseren,<sup>1</sup>  
Tedi A Engler,<sup>1,3</sup> Emily Arntson,<sup>1,2</sup> Hanna Zlotnick,<sup>5</sup> Justin B Dimick,<sup>2,3,4</sup> Andrew M Ryan<sup>1,3,4</sup>

Ceza uygulanan ve uygulanmayan hastaneler arasında  
30 günlük mortalite ve tekrar başvuru açısından  
**FARK YOK**

Uygulanan para cezası HAC'de azalmaya sebep  
**OLMUYOR**

# Changes in hospital safety following penalties in the US Hospital Acquired Condition Reduction Program: retrospective cohort study

Roshun Sankaran,<sup>1,2</sup> Devraj Sukul,<sup>2</sup> Ushapoorna Nuliyalu,<sup>3,4</sup> Baris Gulseren,<sup>1</sup>  
Tedi A Engler,<sup>1,3</sup> Emily Arntson,<sup>1,2</sup> Hanna Zlotnick,<sup>5</sup> Justin B Dimick,<sup>2,3,4</sup> Andrew M Ryan<sup>1,3,4</sup>

HACRP'de kötü performans gösteren hastanelere uygulanan mali cezaların hasta güvenliğini anlamlı derecede iyileştirmiyor.

HACRP kapsamındaki cezalandırmanın sistematik olarak hastane özellikleriyle ilişkili olduğu ancak performans artışı ile ilişkili olmadığı gösterilmiş.

## INSPIRED BY NATURE

SHARKLET'S MICROPATTERN MIMICS THE  
FORM AND FUNCTION OF SHARKSKIN.

## No antimicrobials. No chemicals. Just Sharklet.

Sharklet is the world's first technology to inhibit bacterial growth through pattern alone. The Sharklet surface is comprised of millions of microscopic features arranged in a distinct diamond pattern. The structure of the pattern alone inhibits bacteria from attaching, colonizing and forming biofilms. Sharklet contains no toxic additives or chemicals, and uses no antibiotics or antimicrobials.

Sharklet draws inspiration from the shape and pattern of the dermal denticles of sharkskin. Sharks are resistant to fouling organisms in the water including algae and barnacles.
